

ABSTRACT

The gathering for the SuMas Eid package has been a routine activity since 2006 in East Jakarta. In this social gathering, there are two options, namely goods packages and money savings. The purpose of this activity is to help the community ahead of Eid. Because these activities are still carried out conventionally or are still done by hand and in paper form, a website-based application is made to facilitate this activity. In making this application, it has been divided into two modules, namely the admin module (organizers) and user modules (officers and participants). In this module, we will focus more on discussing the user module (officers and participants). This final project was made using the Waterfall software development method, using the PHP programming language and CodeIgniter Framework and the database used is MySQL.

Keywords: social gathering, officers, participants
