

## ABSTRACT

---

*Mitra Unggas Sonofera Farm is a company engaged in the free-range chicken farming industry and partnerships. The problem with this chicken farm is that when recording feed sales, buying feed, using chicken feed and paying company expenses, this chicken farm is still doing manual recording, namely recording in one book only. Manual recording often causes errors in recording transactions that can affect the preparation of financial statements. For this reason, in this final project, an application is built that can handle problems that often occur by running business processes. The functionalities in this application are feed purchase transactions, feed sales, feed usage, general journals, ledgers, sales reports, purchase reports, stock cards and profit and loss. To overcome the problems that exist in chicken farms, an application is made with a prototype working method. This application is built using the PHP Framework programming language and MySQL database. The end result of this application can help the owner of the preparation of financial statements.*
