

ABSTRACT

Primary school is a building or educational institution that facilitates teaching and learning activities related to the fundamentals of education. Primary school spans six years, from grade one to grade six, and is an institution with well-structured organization where all activities are deliberately planned, known as the curriculum. Assessment plays a crucial role in education, especially at the primary school level. It provides an overview of students' learning progress during their basic education to parents, depicting both academic and non-academic achievements. However, in today's technological era, report assessments are still manually written on paper, which leads to time-consuming evaluations and inconvenience for teachers and parents when accessing student performance information. Therefore, an application has been developed to facilitate parents and teachers in accessing information about student assessments or achievements in real-time. This application is an Android-based grading and recording system for schools that eases the process of assessment and recording for teachers. Additionally, it helps simplify the student evaluation process, allowing parents to easily comprehend and monitor student achievements and observe their grade developments. This enables parents to provide appropriate support for their children's future learning.
