

ABSTRACT

Ayam Kremes Mas Jono is a Micro, Small and Medium Enterprise (MSMEs) in the culinary business sector located in Sukabirus, Bandung, West Java. MSMEs engaged in the culinary field include businesses that have not yet implemented computerized technology to carry out their business processes. There are various problems in the process of purchasing or managing trade products, including still using a conventional system of recording that still uses a manual system. This recording application was built with the PHP programming language, the Codeigneter Framework, and MySQL. The software development method uses the waterfall model Software Development Life Cycle (SDLC). The design process uses the Unified Modeling Language (UML) system modeling method, and the database design uses an Entity Relationship Diagram (ERD). The results of application testing successfully display data features of suppliers, goods, employees, purchase transactions and generate purchase reports, general journals, ledgers, and trial balances.
