

ABSTRACT

Sapeken District, which is still included in Sumenep Regency but its location is far from the city and separated by the sea, requires the people there to use sea transportation to go to cities, for example with the aim of studying or looking for work. Currently buying boat tickets is still using the conventional method, where passengers buy tickets at the counter then pay directly to the officer and then get proof of purchase in the form of a ticket.

Purchasing tickets in a conventional way resulted in several problems. The first problem is that it is still difficult for passengers to get information in finding departure schedules and purchasing tickets due to a lack of management information systems regarding ticket purchases and ship schedules. The second problem is the existence of brokers which results in prospective passengers having to buy tickets at a higher price to get a comfortable place.

Based on these two problems, an information system was created that can provide information for searching ship schedules and purchasing tickets in accordance with the ship's price provisions. It is expected that this ticket sales information system, it can make it easier for prospective passengers to get information on ship schedules and purchase tickets.
