

Abstract

Frontend development in projects using the Iterative Incremental Model method, especially in the use of blade features in Laravel, is one solution that helps consistently work on the user interface. In a project like Villager Financial Controlling, the emphasis on the frontend is very important in creating an attractive and functional interface. The Iterative Incremental Model method facilitates consistency by enabling continuous improvement and early identification of problems. The blade feature of the Laravel framework, as part of UI development, provides a powerful framework for building responsive and structured interfaces.
