

ABSTRACT

In type B hospitals, Mom and Children Hospital is a special health service facility that handles obstetrics, gynecology, and children's health aged 0 to 14 years. The increase in cases of postpartum depression in postpartum mothers affects the importance of good health facilities and can provide space comfort, especially in postnatal care and pediatrics, special design is needed that can help healing psychologically and adequate facilities are also needed for physical healing in accordance with standardization. The design method is carried out through observation, interviews and field studies and also data collection through questionnaires and documentation. The main goal in this design is to create areas and facilities for mother and child hospitals that can support the healing of special users in the postnatal care and pediatrics areas. The results of this research are in the form of implementation of 2D design drawings, 3D modeling and also mockups.
