

ABSTRACT

The Autism Center is a place or building that provides services, including education and health consultations, for people with autism spectrum disorders (ASD). ASD is a condition that varies in a person with several visible characteristics, namely experiencing difficulties in communication and social interaction, difficulty focusing on one detail, difficulty moving from one activity to another, and carrying out actions or behavior with different patterns. recurring (World Health Organization. 2022). Therefore, the interior design of the room can be adapted to sensory needs. This individual is very important. According to (Barker in Laurens, 2004), behavioral settings, also referred to as activity spaces, show the relationship between the architectural environment and user behavior within it. Patterns of human behavior related to the structure of the physical environment are known as behavioral patterns. The aim of the interior design of the Pontianak City Autism Center is to create an interior space that can accommodate therapy activities, consultations, information distribution and a series of other activities for ASD comfortably and safely. Then to create a good spatial layout, especially the therapy area, that suits the needs of each spectrum being handled so that users of the Autism Center for people with Autism can carry out their activities efficiently and safely.
