ABSTRACT

Information system is a set of components of an integrated information to achieve specific goals. With today's busy lecturer who then in terms of value input lectures, lecturers require a lot of time to input values into the database. With a system of values penginputan using sms gateway then the lecturer can do with a way to sms to input values into the database with information systems efficiently.

Making Information System based on SMS Gateway itself through several stages including the design phase which includes the creation of web design, data collection and information, as well as the next stage is the stage of realization of the Information Systems based on the SMS Gateway. The last stage is the stage of finishing which includes the stages of system testing and evaluation system. In the manufacturing process based SMS Gateway Information System is the software used is PHP (consisting of the Apache server and MySQL) as a programming language, Macromedia Dreamweaver 8 is used as a script editor, and the Now SMS as SMS Gateway server.

The results obtained at the end of the project this time is in the form of an Information System based on SMS Gateway can input data directly into a database and can be viewed via mobile phone in realtime without limitation of time, ease of menginputkan value for faculty and see the value for students.

Key words: *Information Systems, Database, SMS gateway, PHP*
