

ABSTRACT

Food is the most important thing for every people . Every year, the number of Student in IT Telkom is always increasing. Seeing the potential of the IT Telkom student growth, the owner of restaurants are trying to make creative menus. However , many students are still difficult to get food because the student have a lot of activity and many schedule, so the student can not choose or search the food with their own taste.

Based on the condition, this final project is creating a system as a center of information to help the student in IT Telkom to process food ordering at the Sukabirus. The system of this application is using android as the operating system and then the application connects with the server that contains the restaurant, the food menus, the prices and the description of the food that can use a delivery order service. The buyer can order food directly through android by choosing the food menu in the application which integrate with SMS (Short Message Service). This application can help the costumers who want to order the food in the restaurant that has a delivery service.

The results of this final project is an application that help the costumer to order the food in Sukabirus region via SMS (Short Message Service) within android system.

Keywords: Food, delivery order, Android, and SMS
