

ABSTRACT

Assets are assets of a company. Asset help the company to run its operation, but if actual assets are not treated and managed properly can inhibit the activities of the company, it is necessary to have a management of assets.

Asset Processing is a way of management assets to contain in the particular company in which the assets are to be recorded and arranged to facilitate the administrators and users to use all assets. The purpose of making this final project is to facilitate the admin office to arrange all the existing assets at the office of a company.

Asset management application is an application that facilitates all data collection activities, reports, borrowing, repayment is done by managers and users so that they are easy to use existing assets. This asset processing applications only handle fixed assets are office equipment. The method used in this application is simply borrowing and repayment using a web-based framework CodeIgniter. This application contains data about the addition, editing and deleting the data and see all office equipment.
