

ABSTRACT

Detective is one of the profession that required to find information that being investigated in fast and comprehensive way. There are several device that used by detective to support and improve their performance, such as camera, laptop, smartphone, and so on. Nowadays, smartphone is widely use to ease detective's work. Detective's wide scope of work and their high mobility, has made smartphone as a practical choice to do intelligence work.

Mobile detective application is an application based on Android operating system. The output expected from this application is data (document and multimedia data about an event that can be categorized as evidence) collected from the field can be sent in one easy-to-use application. Then this data is sent to the server so it can be received by the detective leader as a decision maker, so an immediate action can be taken in order to finish the case in fast and appropriate way.

After testing, the result shows that mobile detective application can be implemented properly in Direktorat Intelijen dan Keamanan Polisi Daerah Jawa Barat. The online reporting system in this application can help intel agent to do their work.
