**ABSTRACT** 

Along with its development, mobile devices, especially smartphones have

dominated human life with all the facilities offered. As well as a smartphone, a

computer also has taken over most aspects of human life. The facilities inside has

attract the attention of peoples, one of them is an entertainment facilities media

player.

In this final project designed a system of remote PC applications which are

implemented on Android-based mobile phone operating system. This application

is built with the Java programming language and implement basic function of

media player by utilizing the motion sensor accelerometer.

From some results of the tests performed, the functional testing, in alpha

testing showed that the application can run all functions and features as expected
