ABSTRACT

Web based application for determining variable costing using order cost method aims to make the calculation of estimated price of goods, financial records, transaction records so that helps convection in determining Testing that has been implemented in determining the estimated price of the goods based on the determination of financing variables and generate reports in the form of journals, ledgers, and income.the estimated price of the goods based on the determination of financing variables and generate reports in the form of journals, ledgers, and profit and loss. Wanted Production Bandung is the Micro, Small and Medium Enterprises (SMEs) engaged in the convection. Management of financial data pricing of goods and recording of transactions still faced problems because it did not records the data in a book or Microsoft Excel when customers order their products. The making of application was using the Waterfall method, the design of the system was using Data Flow Diagrams, database design using Entity Relationship Diagram, as well as programming languages using Hypertext Preprocessor (PHP), database using MySQL and has been tested using the Black Box Testing that has been implemented in determining the estimated price of the products based on the determination variable costing using order cost method and generate reports such as journals, ledgers, and profit and loss.

Keywords: Production Wanted Bandung, Variable costing, Calculations Estimated Price, PHP, MySQL.
