ABSTRACT

Cloud Computing is a on of computing model, when each user able to access content that needed everywhere. Cloud Computing need a huge infrastructure system that can access and run as well without any disruption such as server down. therefore it is need the performance Monitoring system, so that performance of server will function normally. Server that will monitored are Server Openstack. Function of this Monitoring server are to check the disruption or malfunction which are caused the reduction of server's performance. Monitoring also can help the job of administrator to watch server remotely anywhere and can get a notification when server has problem

Keywords: Cloud Computing, Infrastructure, Monitoring, Host
