

Abstract

Business today is certainly familiar to the public. In doing business in the era of advanced today, certainly the software has a major role. Software house is a company that sells software development services to its clients or site. To facilitate the transaction, payment, communicate, and know the progress of the project between the software house and client-or people who want to buy services, it is necessary to bridge the information systems between them, making them easier to conduct transactions, communicate, and know the progress of the project.

Application will be made an android application as an information system project with the data stored on the server. From the information system applications, the project manager can see a list of project requirements of the client, the client can view information about the project progress both in outline and detail, the details of the project cost, and performance programmers based long amount of work handled, and the programmer can update construction progress.

Blackbox testing and whitebox based on Web services drawn the conclusion that the application of web services and applications for the purposes of this android information system successfully implemented

keywords : android applications , information systems, project management system
