

ABSTRACT

The development of information technology very rapidly now among influential on the development of systems of information itself, one of which is the management system of goods. Many government agencies currently very dependent on information systems, therefore the asset management information system need to be applied is more likely that using the base information system therein.

Refers to the function of its own goods management system, is a system which regulates and manages the procurement (acquisition), operation and elimination (disposal) and planning the process where the fourth is an important part in the course of business processes of an organization or enterprise. Therefore required a management information system that can accommodate the needs of stuff above.

This research was conducted using the method of iterative and incremental, the research will produce a goods management system. This item management system itself will be built using J2EE Java programming language and MySQL as the database.
