

ABSTRACT

Traffic unit is one of department in Polrestabes Bandung which handles traffic accident in the jurisdiction of the Municipality of Bandung. Data management in the Traffic Unit includes data based on crime scene management, traffic accident data management, and the management of accident cases that still done manually and it is still not effective. Errors in data traffic accidents is very shunned by members of the police, which led to these direct impacts to the community, leaders and institutions. According to these problems, arise the idea to build a web-based application that can manage data of crime scene traffic accident data, and data status of the case. Application for recording and reporting cases of traffic accidents is an application that facilitates the data management on the Traffic Directorate of Polrestabes Bandung. With application, hopefully the management data on the Traffic Directorate of Polrestabes Bandung can run well, producing accurate reports and the availability of information needed.
