ABSTRACT

Recording sales and receivables management in a company is very important in the business continuity. Because of this the company recording sales gain. But there are still a lot of difficulties in running the business processes in the company when calculating, recording and reporting is still done manually. And if the accounts are not managed properly it can result in losses that would be experienced by the company. This application is built with the background of the recording files are saved too much and should look for the files one by one when they wanted to do the calculations. Receivables management that is applied to this application receivable aging analysis method. In this application was developed using the method of Software Development Cycle (SDLC) or also known as the software development lifecycle approach waterfall model or a waterfall. This application is built using programming language PHP with MySQL database. And this application also generates the accounting records in the form of journals, ledgers and generate sales reports, a list of accounts receivable and accounts receivable aging report.

Keywords: Applications,   Sales,   Accounts   Receivable   Management.
