

## ABSTRACT

water reservoir is an object that is often seen in the upper house to be a means of supporting the needs of the activity at home. water reservoir is widely used by domestic sphere to become a means of saving water and electricity, However, the use of water toren among households having some problems, namely in terms of the average cleaning forcing users into the water water reservoir in to do the cleaning water water reservoir to get maximum results. The method of settlement that will be done to support the data in the project is the final task of data collection techniques that will be to support the theory of data, then proceed to the stage of analyzing the system that is useful to compare existing products with products that are used as a solution of the issues raised. Proceed to the stage where the visualization of the process is the stage prior to the realization of the previous stage. Purifier toren the author of this design has advantages in terms of cleaning water toren that this tool does not use the brush is replaced with water to become an alternative for the cleaning brushes.
