

ABSTRACT

Food delivery order is a service that is provided by a restaurant which can ease a customer in doing a transaction. In Telkom University this service is usually used via SMS to perform an order, the problems that usually occur are how to confirm the order to the customer and market their products. With the development of information technology SMS services which can be bundled with internet service can create an application delivery of food to the region of Telkom University via web-based and integrated with SMS that can facilitate the restaurant in confirming the booking and markets its products. The method that is used in the development of an application is called RAD method, which is a model that prioritizes work on short development cycle and fast. The results of test showed that the application can fulfill with the needs, which means customers can order food, can confirm their orders, create sales reports, cancel the order and make the sales charts.

Keywords: food delivery order, web application, SMS, Telkom University, RAD.
