ABSTRACT

Submissions proposals very usefull from the students. In addition to the submission of funding in order to follow a race, the race of proposals can also find team members that will be used to print a letter of assignment in a contest. But the fact that occur in the field, document storage proposal won the race and evidence of competition still using hard copy. It is possible there will be difficulties in the process of finding the document because it is not collected or damaged documents. Therefore, researchers will build a student application that can handle these problems. To overcome these problems, researchers built an application and scholarship proposals. In addition there are features that are useful event that students know the event list of the race can be followed. The method used is iterative incremental research. In studies using unit testing and usability testing. There are conclusions and suggestions that can be considered for subsequent research in order to develop this application.
