

ABSTRACT

Language is one of the most important element in human life where in language, human can communicate or interact with each other. Deaf children have limitation in their hearing because of the hearing organs isn't functioning normally. Deaf children's ability could develop well if supported by their environment, hence a particular way to tutor them is needed. Most of deaf children are more interested in something visual. Based on the problem above, interaction media to introduce alphabet and basic numeric in sign language for children aged 3-5 is needed. Method used in this research is psychoanalysis therefore this media is designed to make the most of deaf children's language ability. There are some steps needed in order to complete this research. Begin with field research, study modelling, prototype making, etc. Output of this research is deaf children could understand basic alphabet and numeric in sign language based on SIBI before they enrolled to formal education.
