

ABSTRACT

Food price instability happening throughout Indonesia, every month or even every week perhaps every food prices constantly changing, so that Indonesia will be enough community difficulty in determining funds to shop, because of the lack of information on what foodstuffs are rising, the difference in price increases in each region as well as alternative feedstocks that could be purchased by the public, as an ingredient in food rises. Based on things that we will try to make web-based information system, which can provide a solution to the problem, which is named 'KPI (Indonesian Food News)'.

The purpose of the creation of this KPI website expected the public can more easily find information about the price of groceries in each region in Indonesia, besides communities Indonesia can also view graphs of rising prices is also an alternative feedstocks that can be purchased when the foodstuffs are rising.

Research methods used are observation or data collection, problem identification, study literature, and software development (needs analysis, design, implementation, testing and documentation).

The result of this KPI is a website creation community in Indonesia could more easily find information about food Indonesia, society can better get to know food wealth owned by Indonesia, society could cultivate the typical cuisine of Indonesia based on recipes Indonesia in this application.

Keywords: food price instability, website creation, KPI information about food, the introduction of wealth in Indonesia, cultivate Indonesian specialties.
