

ABSTRACT

Order finishing process become one of the most important things to Sultan Agung Endah (SAE) Meubel in fulfill consumer needed and for instance influence company works. Because of that the information about kinds of order, material stock in warehouse, takes order date, the purpose must be comprehensive, appropriate, and quick so can be the solution to solve the order problem. But, the fact in the company is still facing the difficulties of exact and speed data documentation because the information system in SAE meubel which consist of order registry, purchases goods, and inventory reports for material stock is still done manually. Because of that it needs to make a new system which is computerize so registry, calculation, checking, and data storage can be done well.

Primary data in this information system prototype can get from the interview, even its about the problem and the weakness in old system but also the needs of information of new system. Secondary data is get from collect documents which has in study case place. In software developing, the application that used is Delphi 7.0 with MySQL database. With the best choice of software and application information system, the user needed especially fast, exact, and accurate information required can fulfilled.

Mainly, this information system can be used as helping tool for user to processing datas in which solving order process and in other words can result the information that needed for the company owner to making decisions.
