

ABSTRACT

The development of information system technology especially in internet, has encouraged the growth in a need of internet for everyone in many fields, that educated fields is included, such as college student. Jatinangor is a potential market for business of internet, that has a huge amount of college student, specially living in the boarding house. It's provided by on appearance of internet service, that can be accessed from student's boarding house, which is bargained by Global Akses with a enough consumer though many works at Global Akses are still work manually. Which make many demands can not be done because of late report as an input for manageable decision.

For that reason, lecturer makes a design of management information system for Global Akses company with the aim for design a management information system to help a process of business on the information architecture which is result from analysis based on BSP method. The aim of analysis is to make a design of system with BSP method. The information architecture, that's resulted by analysis based on BSP method, is produced by five subsistem, which are management, technical, marketing, administration, and financial.

The subsistems with class of data and process from information architecture, has been designed and later become a basic for arrangement of information system for this Global Akses. So that, for it's application, the system is devided into six programs, which are general manager, marketing, technic, finance, and orderng. So that, this application can help the management of Global Akses for process of business and get a recent data quickly and a need of report. The resulted of the analysis showed that design same as the architecture system, all of the fuction of the program worked successed, and the user give good value to the program.

Key Word : Management Information System, Business System Planning (BSP)
