

ABSTRACT

Generally density of Bandung population, causes population consumption of primary good ; PT. Yomart Rukun Selalu as a retail company that focusing at segment, needs for doing some technical of distribution management effectively and efisiently. In this find text, the writer will doing planning information system of Yomart retail goods distribution manajemen become. More controlled than Yomart existing system. It becaused the existing system doesn't running effectively, the connection of the main warehouse with brench shop just request order of goods not full control. Distribution management of goods, is the main thing of retail industry, should run effectively, so they can support warehouse and selling system.

The method that use is distribution management information system, it based on computer system that planed for collecting saving, and analyze retail needs, so they can created the perfect system between main warehouse, brench and supports of goods distribution tools. It included the mapping for visualization that help controlling the distribution. The numbers of goods, forecasting of goods needs, and consumer demands, is the data base which connected in all system so that can reduce "lost" in system. Beside- that it can reduce existing process because goods checkly will automatically updated by the main warehouse.

Management procces of goods distribution is started by analyze the needs that needed by system. It is include existy system, information, input and output, user, hardware and software specification. After that, it will be done. Planning include. Information planny and database. Then it will be analyze of system create feedbacks the application in the find text, used flash macromedia 8.0, visual basic 6.0 and My Sql software.

The application will make Yomart develop their business for opening the new brench, for serving the new demand, easily and optimally.
