

ABSTRACT

Foodelivery is an application that is used to order food and beverages from certain food places that already have delivery service and have worked with this application. This application is used by customers, sellers, and couriers to track orders delivered to the customer has address. The problems that are often encountered by the customer is not know the location of the desired food seller, it is difficult in finding the desired food menu, it is difficult to find a meal that suits the budget that is owned. The problem that is often encountered by the seller is to make sales reports that are still manually, food vendors are asked to provide inter delivery services quickly and efficiently, food vendors are required to have a promotional media disseminating products owned.

The objectives of this study are providing online booking feature and order order status checking, providing ordering feature, providing order management feature, providing feature used to make sales report on food delivery service

This application is built using SDLC method with waterfall model. The technology used in this application development is Codeigniter Framework 3.xx for PHP 7, HTML 5 + CSS, and XAMPP bundle.

Keywords: codeigniter, food delivery, web application, waterfall
