

ABSTRACT

SDN 1 Demakan is a primary school has 6 grade levels from grade 1 to grade 6, which at each level has approximately 30 students. In processing all the data still use the process of recording. As contained in the data processing Education Contribution Education (SPP). The result of difficulty in making a recap of the report makes no match in matching data. The frequent arrears or delays in payments and also the difficulty of giving warnings to late students in paying also become one of the obstacles that are often experienced. With these problems made an application that can help organize all pengelohan data donation education coaching. Programming language used PHP Hypertext Processor (PHP) and MySQL as data storage. In the process of making the application, there are steps according to the phases in the SDLC method. Waterfall model. This application uses PHP programming language, MySQL database and testing using Blackbox testing. Based on the test results show that the student data processing features, data spp, printing reports and report letters produce valid results. This is indicated in the absence of error from blackbox testing. The user entered the data incorrectly, got an error message so the user knows that what he has entered is correct or not.
