Abstract

RSUP Mohammad Hoesin is the main referral hospital in South Sumatera. Due to the hospital management report still using manual method, the management has difficulty to get information of medical service indicator that can measure performace of hospital service. Therefore, in this research will be designing Executive Information System (EIS) that can support the process of medical record data to display information of medical service indicator. The design of this system requires data warehouse through ETL (Extract Transform Load) process on the hospital operational data and display the result of data analysis with OLAP (Online Analytical Processing).
