ABSTRACT

This final project aims to create "Community Based Telkom University Startup Applications". This application was created because of the development of startup actors in the campus Telkom University needs a media container to record the startup and media players as a forum startup booster provides information about startup members, promotional events and ease of registration of events and displays news about the startup obtained from the results Meeting community startup Telkom University. Making this application using waterfall method, built with codeliter framework, PHP programming language, MySQL database and tools editor using Sublime. Testing application mengunkan Black Box Testing and use UAT done by parapenguna startup to conduct evaluation on the application. With this application can help startup actors get information about startup members, event information as well as access rights registration and news news about startup. This application is also able to function to drive the digital startup industry and become a companion for the startup in running his business career on the campus of Telkom University.
