

ABSTRACT

In general, the order delivery service in Indonesia is an order delivery service with customer segment that is too wide reach. While looking at the condition of the existing organization buildings there are times when the inter-messaging service on the organization's environment is needed. In general, the canteen in the organization is located on the bottom floor or even far from the main building. This is what causes the organization's civitas lazy to go to the canteen. In addition to these problems, sometimes the seller in the canteen is difficult to keep the transaction records that increasingly accumulate, the seller automatically finds it difficult to recover the revenue it receives. Eatime! Is a service delivery solution with customer segment that will be addressed is the organization. The organization in question consists of companies either BUMN or BUMS, government agencies, or educational institutions. Eatime! Is an application management order delivery food based on android that provides the feature of ordering the menu into the canteen so as to facilitate and optimize the messaging services between an organization. By using the app eatime! Merchandise merchandise not only can be known by the civitas organisai where the seller resides, but also can be known by the civitas other organizations incorporated in the app eatime. That way the market opportunity for bigger sellers. Eatime also provides features that can facilitate the seller in recap transactions and see the revenue owned by the seller. Quality app eatime! On the user this seller has been measured using the McCall method for product operation perspective. Testing the quality of these applications get a value of 77.16% with good results. The test involved 7 randomly assigned respondents who were assumed to be sellers.
