

ABSTRACT

Cloud Computing is a term in computer science which means cloud or cloud computing could be called also The Cloud. Cloud Computing is a network of computers that have a single server as a storage data and any data that is stored is permanent and users can access the data simultaneously via internet access. Because it can be accessed simultaneously needed Traffic monitoring to monitor network conditions on Cloud Server in order to perform a prevention network to ensure the smooth and keep it running properly. Munin is a monitoring application based on metric graphs. Can automatically generate a graph of the performance of daily/weekly/monthly/yearly and other important reports. monitors core system resources, such as memory, disk space, CPU usage, application servers such as MySQL, Apache, and Squid

Keywords: Cloud Computing, Monitoring, Munin, Data , User
