ABSTRACT

Auditor information system is a work that aims to examine the existing system in a company so that it fits with the vision and the mission of the company.

The absence of a web-based information systems that facilitate the company to seek a competent information systems auditors, making the company still difficult to search for information systems auditors because they use the telephone to contact the media organization Ikatan Audit Sistem Informasi Indonesia (IASII). Therefore, it needs to be community applications web-based information systems auditor to assist the auditor of information systems to promote yourself also allows companies find and request consultations to auditors.

The method used for the making of the application is a method of waterfall. Waterfall stages of processing which do interviews interface to several speakers who related that the auditor and the company, designing based on analyzing result of interviews, coding the system, system testing, running app and maintenance. This web application was created using CodeIgniter framework, the programming language PHP, MySQL, Apache Web Server and tools using Notepad ++ editor.

Thus, any activity related to the search by the company and offers services by the auditor of information systems mainly freelance, can be helped with this application.
