ABSTRACT

Geographic information system is an information system that stores spatial or geographic data, and other supporting attribute data. System like this is very usefull not just for public information dissemination but, could also be usefull for government agencies to manage and maintain their assets. But, this kind of information system is not widely used yet in local government agencies especially in kecamatan level.

In this research, a web based geographic system information that presents data about healthcare in kecamatan Dayeuhkolot is made. This system is using map layer form Google Maps API, statistic data processing using ChartJS, and MySQL as database management system.
