

Abstract

Augmented reality is used to make objects look more real. Technology that combines 2D and 3D virtual objects into a more tangible environment. This Augmented reality is also represented in our body prayer. The prayer of the corpse is done by the Muslims when there are people who died. Many people who learn to pray the body through books, videos, posters etc. And not a few also people who do not perform the body prayer because they do not know clearly about the body prayer. That way we are making augmented reality based alms prayer that can be used to increase knowledge and insight about the corpses' prayer. Users can learn about this body prayer in a more real way because the object will look more clear. The object is in the form of animations so that users can know the movements and readings of anything related to the corpse's prayer. This Augmented reality was built and created in such a way as to showcase examples of people performing a prayer in the form of animation. This Augmented reality is in 3D so users are very easy to learn to pray. Many people who perform the prayer and not many who do not mengetehui about the body prayer. With the "Augmented Reality Based Bodies of Faith Application" hopefully can increase and increase knowledge about the body prayer.

Keywords: Augmented Reality, 3D, Corpse prayer, Corpse prayer augmented reality.
