ABSTRACT

This era of globalization so many people are using technology to meet their needs. No exception in the public service. One service that is in need of technology is community service in the process of correspondence by the service department or the Cipagalo village community. In the service section of the activities handled the making of a letter that is still typed using Microsoft Word, the number of certificates is still duplicate and the preparation of reports for certificates has not been ascertained correctly the number of making a certificate made. Based on these problems in the final project is made an application that can help deal with the problems mentioned above. This web-based application uses PHP programming to be used as a user interface and MySQL as database. This application is expected to help support the process and submission of a certificate for the community and the report of a certificate made by the service department.

Keywords: application, public service, Interface, MySQL, database, village.
