ABSTRACT

Planet production is one of manufacture companies home industry which engaged in the clothing supplies convention which have an address Suropati street no. 92, Bandung, West Java. There's obstacle in Planet Production that is calculating of Cost Of Goods Manufactured unconsistently , because they are still calculating with approximate that based on usage of raw material , auxiliary materials, and production process that charged to product. In determinining overhead factory cost that charged to every order hasn't apply calculation based on standard accounting. this thing is also marked by hasn't been noted production cost regularly with using a method. For overcome the trouble, then this application made by programming tecnique which oriented object with programming language PHP Code Igniter and database MySQL. Software development method that use is Evolutionary Prototype Method as development model in constructing application. Evalutionary Prototype is prototype that on again and again developed until the prototype fulfill finction and procedure that needed by system. Therefore , this application can handle calculation Cost Of Goods Manufactured that be adapted with production needed every order in planet production.

Key words ; Cost Of Goods Manufactured, MySQL, PHP, Code Ingniter (CI)
