

ABSTRACT

Extracurricular monitoring activities that are running are considered lacking because the student guardian cannot know the activities of their students after school hours are finished. Besides that students can not carry out extracurricular activities because students only take the final result of the activity. The trainer also finds it difficult to recap all the different amounts and numbers of students with that reason to make, to facilitate extracurricular activities and recapitulate all extracurricular activities with web-based applications that use PHP programming language, using the Code Igniter framework and database PHPmyadmin. After spending on activities that are suitable for extracurricular activities for students, you can manage existing activities and can check extracurricular activities.
