

ABSTRACT

Activities carried out in the Jatigede Reservoir are quite often, because every day there are activities in the Jatigede Reservoir. But the strong streams caused by the wind and the depth of the Jatigede dam can also harm the surrounding the community and visitors. The depth of the Jatigede reservoir are different, the depth fits around with besige area. Tidal water reservoir that is not stabilized also dangerous for the people around, because when receding, the area that was once flooded can re-appear surface and disrupt the boat path citizens. The absence of markers in dangerous areas poses a threat to the surrounding the community and visitors, as residents themselves do not know which areas should not be traversed by boats or wherever possible, due to depth, current and door water reservoir. Came the idea to design a product that in the future can keep the safety of local people and visitors Jatigede. So that can make the community to know and not approaching the prone area or red zone. For that we need a design marker that is tailored to the circumstances surrounding environment.

Keywords: Markers, Dangerous Zones, Jatigede Reservoirs.
