

ABSTRACT

Unemployment rate in Indonesia reached 7 million people or about 5.5 percent in 2017. It is due to various factors, one of which lack of skills in a particular field. Not having the skills or skills in a field makes many people have to try harder than those who have the skills. In addition, some people also confused who, where and how they can learn these skills.

To overcome the problem, then do the design of community empowerment website with name "HERO" using HTML, CSS, Bootstrap, PHP, and Javascript with database using MariaDB. In this website, consists of 2 types of users are Agent of Change (hereinafter shall be called Hero) and Society (hereinafter referred to as Recipient). For Recipient, they can create an activity related to community empowerment. So it is with Hero, who can participate in activities that have been made by Recipient. In addition there is 1 type of user who can only access through the website, which is an admin. Admin is responsible for validating the activities created by the Recipient, and performing data reporting on the activities occurring within the application.

In this final project test results obtained where on the website, admins can view data such as activities that have been created, registered users, and users who participate in activities created. In addition, the admin can also validate activities and input data such as activities, categories, and universities.

Key Words : website, HERO, admin, data reporting, community empowerment
