

ABSTRACT

Application Data Collection Health Service Center in Bandung Regency Based Android is an application that is built using waterfall method with the language programming Java, PHP, JSON and using MySQL as database server. This application is useful to provide information on health services in Bandung District to the Community of Bandung regency. The application also features the closest health service search feature and general health service information around Bandung Regency. This application is under the auspices of Bandung District Health Office who still do not have enough information systems to cultivate. Dissemination of health service information undertaken by the District Office of Bandung still use the website and health care data in the website is still not complete. With the application to be built this data collection will be neatly arranged, because it will be connected with the dashboard application of health services district of Bandung who will retrieve data health services from the application and the dissemination of information systems will run smoothly, there is also additional search for the nearest special health services for communities that use applications to be built.

Keywords: Information Systems, Health Services, Community, Bandung District Health Office, Search.
