

ABSTRACT

The need for data transfer between devices is one of the needs of today's technology. Switching data between devices is intended is the transfer of existing data on the media device to the storage device that has the ability to connect to the network. In the application of Muslim Assistant to be built, there is no web server that can store or serving location data between devices to the server. Based on these problems, will be built application Muslim Assistant Administrator and API module that can be data transfer solution of location data between devices to the database. This application is built using waterfall development method, PHP programming language with Laravel framework, with MySQL database. This application tested with black-box testing method and test results have proven that this application has reached the goal of the existing problems.
