The tulle fabric who has transparency characteristic usually used as fashion but it waste hard to recycling. To finish this research then it is needed to use the right method, the research method used is observation, interviewing and literature research. Based on observation and interviewing results on the supplier tulle fabric waste to get data on how much tulle fabric waste is produced. The literature research method was carried out to confirm the data from the technically side, argument and phenomena then to use experimentation technic to produce more exploratory tulle waste processing.

In this final research, carried out research for alternative use of processed tulle fabric waste in an explorative manner with tapestry techniques in the details of fashion accessories products. The results of this research are the processing of fabric waste used in fashion accessories products, which is footwear and bags with tapestry techniques. The product that has been made can be concluded that in terms of the main characteristics of the tulle fabric that is identical to transparent and soft, created the new visual look and positive impacts obtained there is opportunities from the processing waste other than fashion clothing products but also in fascion accessories.

Keywords: *tulle fabric waste, upcyling, exploration, tapestry and fashion accessories.*
