

ABSTRACT

A bus stop is a place where buses can take on and off passengers. Bus stop also can be used by all people without exception. However, until now the construction of bus stop in Bandung City still cannot fulfill the rights and needs of the elderly people when using bus stop facilities. The purpose of this design is to redesign a bus stops that are accessible without neglecting safety and comfort and considering to the needs of the elderly. The method used in this design is a comparative method by comparing data on the field with literature. Data is collected by observation, documentation, and literature studies techniques. From the research, a bus stop had to be created with facilities that fulfill the needs of the elderly and considering the literature that was in effect. The conclusions obtained from this research is designing bus stops with the accessibility so it can be safe and comfortable to use by the elderly people.
