

ABSTRACT

This study explains the development of applications to support the management of Community Information Groups (KIM). KIM is a government program to realize people who are seeking information in Indonesia. KIM is designed as a group that is formed independently so that development will depend on its own community. provide an overview of the application development and how the information society achieved through the KIM program. This is also in accordance with recommendations from the local government regarding the achievement of information society through the KIM program. In this study using the waterfall method that is with 5 steps and carried out sequentially the stages of development activities consist of: needs analysis, design, coding, testing, and operation. Case studies conducted at DISKOMINFO Bandung Regency based on the results, there are still obstacles in conducting KIM data collection. and the maximum management of KIM that has been conducted by DISKOMINFO is that there are still many problems in implementing the KIM program.
