

ABSTRACT

Applicable mobile applications in real-life usage develops significantly every year that the usage makes it easier for users to do activities more efficiently and more effectively. This motivates us to create the final project that can be used in pediatrics medical sector especially the child development. We offer a software application that uses Android as the basic platform that provides questionnaires which is used to evaluate the child development condition.

This application contains questionnaires about pediatrics related topics considering children development toward the parents without doctor or medic roles required nearby. From the inputs that can be assessed by answering the questionnaires, outputs will be given by the application which can tell information and description about the child development condition.
