

ABSTRACT

In the current era of globalization, access to information can be done more easily by using the internet. Judging from the results of infographic data, almost a quarter of Indonesia's population uses internet technology. Information systems are formed using the PHP programming language and the type of database design using MySQL. Referring to the above phenomenon, this report was made by examining the making of a web-based information system application for the booking order system at the Alvion salon.

The first step is to design a system design using graphical notation. This design involves 2 actors who have different activities, namely admin and user in making booking orders. In order for the design to produce good results, then the software development process model applied using a component-based construction approach so that it can produce a functional system.

In this study it was concluded that by implementing a web-based booking order system design by means of system development methods and graphical notation, customers and business owners can easily access the order data because the system is connected online. Besides this information system, consumers are also facilitated in the process of booking orders.
