

ABSTRACT

The writing of this report aims to design the system in dry leaf processing bins which are located in Bandung city hall garden. As for the problem at this writing is because the amount of dried leaf trash scattered in the city hall garden makes the place uncomfortable to visit. In addition, the method used by field survey is to collect data that will be used in this design. The design of this dry leaf trash can make the environment in the city hall cleaner and to make it easier for janitors to sweep the scattered leaves. The conclusion of this design is the design of dry leaf processing bins using a leaf counting system.
