The writing of this report aims to reporting the process of designing the game facilities that will be placed in the Taman Superhero Bandung. The city of Bandung has a variety of tourist destinations. Taman Superhero Bandung is one of the tourist destinations for residents of Bandung and outside the city of Bandung. The problem of several parks issued through the visitor's point of view is the lack of land and materials from facilities that are not strong and porous. Data collection is done by visiting the park directly and conducting interviews with visitors about the playground in the Taman Superhero Bandung. The solution to this challenge is to design park game facilities that must have materials that can survive against the weather of Bandung, as well as strengths that can increase the durability and age of playground facilities. To minimize land use, facilities that are usually separated between game facilities with the others will be combined so that they can be used to maximize land use.
